FEDERAL RECORDS

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 12/16/2014 has revealed that there are 3 NPL sites within the searched area.

EXECUTIVE SUMMARY

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 10/25/2013 has revealed that there are 3 CERCLIS sites within the searched area.

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 10/25/2013 has revealed that there are 4 CERC-NFRAP sites within the searched area.

EXECUTIVE SUMMARY

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 12/09/2014 has revealed that there is 1 RCRA-TSDF site within the searched area.

EXECUTIVE SUMMARY

2020 COR ACTION: The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

A review of the 2020 COR ACTION list, as provided by EDR, and dated 11/11/2011 has revealed that there are 2 2020 COR ACTION sites within the searched area.

EDR PROPRIETARY RECORDS

EDR US Hist Auto Stat: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Auto Stat list, as provided by EDR, has revealed that there are 35 EDR US Hist Auto Stat sites within the searched area.

Summary Details:

Conditions at Proposal February 7, 1992): The Crater Resources, Inc./Keystone Coke Co./Alan Wood Steel Co. site is located at 2200 Renaissance Boulevard, Upper Merion Township, Montgomery County, Pennsylvania. The site consists of three inactive quarries on an undeveloped parcel of land in a mixed industrial/residential/commercial/agricultural area. From 1918 to

1977, Alan Wood Steel Co. disposed of waste generated in its coking facility located in Swedeland, Pennsylvania, into the three quarries. After the company declared bankruptcy, the ownership of the coking facility and property was transferred over a 3-year period to Alabama By-Products Corp. Keystone Coke Co., a wholly-owned subsidiary of Alabama By-Products, continued to dispose of waste generated in the coking facility into one of the quarries until 1980. Since 1979, Crater Resources, Inc., has owned the property. Quarry No. 1 covers 2.23 acres and is 10 to 20 feet deep. It was used for disposal of phenolic and tar wastes from approximately 1918 to 1965 via a pipeline from the Alan Wood Steel coking facility. The quarry has been filled in with demolition wastes. Quarry No. 2 covers 0.69 acre and is 15 feet deep. Wastes similar to those deposited in Quarry No. 1, as well as solid wastes, including cinders, bricks, and paint cans, were trucked in for an unknown period. This quarry has also been filled in. Quarry No. 3 covers 3.25 acres, ranging in depth from 60 feet at the western end to 10 feet at the eastern end. This quarry is also known as the waste ammonia liquor (WAL) quarry or lagoon. Phenolic and tar wastes were deposited in this quarry from approximately 1918 to 1980. During 1977-79, the Pennsylvania Department of Environmental Resources (PA DER) sampled WAL discharges to Quarry No. 3, ground water discharges to neighboring quarries, and area wells. PA DER sampling documented elevated levels of cyanide, ammonia, and phenol in the WAL discharge and in ground water in the area. In May 1979, EPA investigated possible sources of contamination threatening Upper Merion Reservoir, a public drinking water source. EPA found phenolic compounds, benzene, naphthalene, and other organic contaminants in the WAL quarry. In May 1983, EPA found benzene, toluene, phenolic compounds, polycyclic aromatic hydrocarbons, cyanide, iron, lead, and arsenic in liquids and sediments in the bottom of the WAL quarry. In June 1990, EPA resampled the site, collecting samples from waste and soil in the WAL quarry, an area of ponded water near the quarry, a borehole drilled into the fill material in Quarry No. 1, off-site monitoring and private wells, and the Upper Merion Reservoir 1 mile to the northwest. Waste in the WAL quarry contained elevated levels of cyanide, arsenic, benzene, lead, iron, polycyclic aromatic hydrocarbons, and other contaminants. An estimated 77,000 people obtain drinking water from public and private wells within 4 miles of the site, the closest a private well 0.19 mile from the site. Status October 1992): In a June 1992 visit, EPA found three ponds filled with stagnant water in the bottom of the WAL quarry. EPA is conducting a search for parties potentially responsible for wastes associated with the site and will solicit the participation of those identified in cleaning up the site. Also, EPA is planning for a Remedial Investigation/Feasibility Study to determine the type and extent of contamination at the site and identify alternatives for remedial action. The description of the site release is based on information available at the time the site was scored. The description may change as additional information is gathered on the sources and extent of contamination. See FR 5600, February 11, 1991 or subsequent FR notices.)

Site Description: The Crater Resources, Inc./Keystone Coke Co./Alan Wood Steel Co. Superfund Site (Site) is located in Upper Merion Township, Montgomery County, Pennsylvania, approximately 10 miles northwest of Philadelphia. The Site covers approximately 95 acres, much of which is now developed as commercial office complexes in various parcels. The remaining undeveloped portions of the Site, excepting Quarry 3, are slated for similar development in the near future. The Site is generally bounded by Crooked Lane to the west, Renaissance Boulevard to the north and east, and the Gulph Mills Golf Club to the South. The area surrounding the Site is made up of industrial, commercial, residential, and undeveloped land parcels. Quarry 3 is located south of Renaissance Boulevard, immediately southeast of Quarries 1 and 2 and is bounded on the south side by the Gulph Mills Golf Club. It is the only open quarry on the Site. It is approximately 8 acres in size and contains three relatively small ponds, a plateau area, several exposed bedrock faces, and several soil piles. This quarry will remain as an undeveloped area for the foreseeable future. Previous investigation has determined that there is no private well use as a potable supply within the area potentially affected by Quarry 3. Upper Merion Township requires all of its potable water users to connect to public water if there is a public main available, although non-potable wells are permitted. Surface water drainage is generally eastward towards the Schuylkill River, approximately one mile to the east. Southeast portions of the Site, including the Gulph Mills golf course, drain to Matsunk Creek, which then discharges to the Schuylkill River. The Potentially Responsible Parties (PRP) Group conducted a Pre-Design Investigation (PDI) of Quarry 3 from June to September 2003 in accordance with the approved Remedial Design Work Plan for Quarry 3 (Work Plan). Sampling and analysis of the quarry soils were conducted to refine the characterization of the extent of soils to be removed in

accordance with the Record of Decision (ROD) standards, to evaluate the Plateau Area directly, and to gather sufficient data to prepare preliminary calculations for the volume of affected soil. Pond water sampling and analysis were conducted to evaluate the feasibility of on-Site treatment and discharge of the treated pond water in accordance with Pennsylvania Department of Environmental Protection (PADEP) surface water discharge requirements. Additional sampling and analyses of the Quarry 3 sediment, plateau material, and surface water were performed during February and March 2008 for the purposes of waste profiling and collecting additional water quality information for evaluation of treatment systems. At the time of the 2003 PDI, approximately 2.6 million gallons of water were present in the three ponds. Water level measurements conducted in February 2008 indicate there may be as much as 3.6 million gallons of water in the ponds, due to accumulated precipitation since 2003. The surface water concentrations of constituents from the 2003 sampling event in some cases exceed the Pennsylvania Surface Water Discharge Criteria provided by the PADEP for Matsunk Creek. The concentrations of constituents in the 2008 samples collected at the center of the, water column only exceeded the Pennsylvania Surface Water Discharge Criteria for selenium. Concentrations were generally higher in Pond 1 than in Ponds 2 and 3, and generally higher with depth. However, all concentrations were at levels that could be treated by a mobile treatment system. The PRP Group submitted a report summarizing the 2003 PDI soil/sediment results in December 2003 and met with EPA in November 2004 to discuss the soil data and the methods that could be used to demonstrate compliance with the soil/sediment cleanup performance standards in the ROD. The PRP Group submitted a report titled "Technical Memorandum Development of Target Naphthalene Concentration in Quarry 3 Soils" on December 20, 2006. This report was submitted as a final document on March 13, 2008. This report summarizes the numerical vadose zone fate and transport modeling that was completed to identify an alternative residual naphthalene cleanup standard that would support the existing groundwater cleanup standards. EPA issued a ROD for the Site on September 27, 2000. An Explanation of Significant Differences addressing Operable Unit 1 was completed in April 2009.

Summary Details:

Conditions at listing December 1982): The Stanley Kessler Site is in King of Prussia, Montgomery County, Pennsylvania. From 1962 to 1978, solvent wastes were disposed of via a floor drain into a septic tank-cesspool system. This practice resulted in contamination of ground water with organic

compounds such as chloroform and trichloroethylene. The ground water in the area feeds the Upper Merion Reservoir, which supplies drinking water to approximately 170,000 people. Status July 1983): The company removed the septic tank and cesspool. EPA is negotiating with the company for complete site cleanup.

Site Description: The 3.21-acre Stanley Kessler site is located at 103 Queens drive, King of Prussia, Upper Merion Township, Montgomery County, PA. The property contains a 14,760 sq ft one story masonry building where wire is degreased and respooled. A tributary of the Schuylkill River flows adjacent to the site. The current source of drinking water for the businesses and homes in the site vicinity is the Upper Merion Reservoir (UMR), located 3,500 feet north of the site. Since 1963, solvents have been used at the site for degreasing and repackaging welding wire. In 1979, TCE and other VOCs were detected in the UMR. Large amounts of VOC and metals contaminated soils were discovered at the Stanley Kessler site as well as VOCs in the groundwater. A removal action followed, including soil excavation and groundwater treatment, which removed the majority of contamination. In 1994, contaminant concentrations were still above drinking water quality standards.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

PA-EFACTS (Pennsylvania - Environmental Facility Application Compliance Tracking System) is a Department-wide database that provides a holistic view of clients and sites (including facilities) that DEP regulates.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

ICIS (Integrated Compliance Information System) is the Integrated

Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Summary Details:

Conditions at listing (September 1983): Tysons Dump is located near a residential area in Upper Merion Township, Montgomery County, Pennsylvania. The privately owned site consists of seven unlined lagoons covering about 5 acres. In the 1970s, it accepted sludges and liquid wastes, primarily chlorinated and other organic solvents, and dumped them into the lagoons. Leachate from the site flows into the nearby Schuylkill River, which provides drinking water to over 30,000 people in Norristown and other nearby communities.

The State detected organic compounds in the air, which pose a potential threat to the heavily populated residential area nearby. In March 1983, EPA used 235,000 in CERCLA emergency funds to fence the site and to construct a leachate collection and treatment system. In August 1983, EPA prepared a remedial action plan for the site. Status June 1984): EPA has completed a remedial investigation and is now working on a feasibility study to identify alternatives for remedial action at the site.

Site Description: Synopsis: In 1984 EPA issued a Record of Decision (ROD) for the excavation and off-site disposal of contaminated soils at the Tyson's Site. Before the 1984 ROD was implemented, a revised ROD was issued on March 31, 1988 ("1988 Revised ROD"). ROD Amendment EPA/AMD/R03-96/225 modifies the selected remedy described in the 1988 Revised ROD. In the 1988 Revised ROD, EPA selected a soil vapor extraction ("SVE") remedy for lagoon area soils. The 1988 Revised ROD also specified the installation of a groundwater recovery and treatment system to prevent site-related compounds in the groundwater from entering the Schuylkill River. The Responsible Parties ("RPs") signed a Consent Decree ("CD") with EPA on June 20, 1988 to implement the 1988 Revised ROD. An SVE system was designed and constructed during the Spring and Summer of 1988 and full scale operation of the system began in November, 1988. Since then, the SVE system has removed approximately 200,000 pounds of volatile organic compounds ("VOCs") from the lagoon area soils. However, SVE performance has been limited by low contaminant volatility, soil heterogeneity, soil moisture and low temperature which have contributed to declining VOC removal rates. Although several enhancements and modifications have been employed to improve performance, the SVE system has reached a low asymptotic limit of mass removal and will not achieve the cleanup standards specified in the 1988 ROD in a timely or cost effective manner. In accordance with the CD, a Focused Feasibility Study ("FFS") was conducted to identify an alternative remedial action for the lagoon area soils. ROD Amendment EPA/AMD/R03-96/225 addresses lagoon area soil contamination not fully remediated by the 1988 revised ROD. ROD Amendment EPA/AMD/R03-96/225 does not modify the 1988 ROD with respect to the groundwater recovery and treatment system. Expanded: The Tyson's Dump Site was owned

and operated by companies owned by Franklin P. Tyson and by Fast Pollution Treatment Inc. (FPTI). The stock of FPTI was owned by the current owner of the land, General Devices, Inc. (GDI) and by Franklin P. Tyson. GDI was active in the management of Fast Pollution Control Inc. The Pennsylvania Department of Environmental Resources (PADER) ordered the site owners to close the facility in 1973. During closure, the lagoons were reportedly emptied, backfilled, and vegetated, and the contents transported off-site. In January 1983, EPA investigated an anonymous citizen complaint about conditions at Tyson's and subsequently determined that immediate removal measures were required. These measures included the construction of a leachate collection and treatment system, drainage controls and cover over the site, and the erection of a fence around the lagoon area. Between January 1983 and August of 1984, EPA and its contractors conducted a series of investigations primarily in what is now referred to as the On-Site Area. The On-Site Area is defined here as that area south of the railroad tracks erected during the emergency response measures. In December 1984, EPA issued its Record of Decision (ROD) for the On-Site Area which recommended the following remedial actions: - Excavation and off-site disposal of contaminated soils and wastes to a permitted Resource Conservation and Recovery Act (RCRA) landfill. - Upgrading the existing air-stripping facility to treat leachate, shallow groundwater and surface run-on encountered during excavation. - Excavation and off-site disposal of contaminated sediments within the tributary which receives effluent from the existing air stripper. Following issuance of the ROD, EPA began remedial design for the selected alternative in January 1985. This design included additional borings throughout the lagoon area to define the volume of material to be excavated. In August 1985 through November 1985 EPA performed additional borings and magnetometer surveys throughout the lagoon area to better delineate the areas to be excavated. Operable Unit 02: In the fall of 1985, Ciba-Geigy Corporation agreed to conduct a further investigation of the Off-Site Area, the need for which was described in the December 1984 EPA ROD. The Off-Site Area is defined here as the area outside of the security fence including the deep aquifer (bedrock aquifer). EPA subdivided the Off-Site Area into five sub-areas or "operable units." The Off-Site Operable Units included the following: - Deep Aquifer - Hillside Area - Railroad Area - Floodplain/Wet lands - Seep Area On May 27, 1986, an Administrative Consent Order (ACO) signed by EPA and Ciba-Geigy Corporation was issued by EPA for the Off-Site Operable Unit Remedial Investigation/Feasibility Study (RI/FS). In November 1986 Ciba-Geigy Corporation initiated an on-site pilot study using an innovative vacuum extraction technology process. Due to zoning restrictions, the pilot study operated for only a short duration (less than 10 days). However, in May 1987, the pilot study was permitted to operate for more than three weeks. In December 1986, Ciba-Geigy submitted a draft Off-Site Operable Unit RI Report to EPA. This report indicated that much of the site-related contamination had migrated off-site and into the deep aquifer toward the Schuylkill River. On March 24, 1987, a second addendum to the off-site RI/FS work plan was submitted to EPA by Ciba-Geigy Corporation. This addendum included a detailed investigation of the Schuylkill River and the installation of wells on the north side of the river. In June and July 1987, four responsible parties, Ciba-Geigy Corporation, Smith-Kline Beckman, Wyeth Laboratories, and Essex Group submitted a proposal to EPA for clean-up of the on-site (lagoon) areas, upgrading of the leachate collection system and cleanup of the tributary sediments. Additionally, the parties proposed to initiate groundwater remediation measures since the information contained in the draft Off-Site Operable Units RI report indicated that much of the contamination formerly in the lagoon areas was now in the aquifer system, down gradient of the site, and was discharging to the Schuylkill River. The parties' proposal was based on a Comprehensive Feasibility Study (CFS) submitted to the Agency on June 15,

1987. The CFS was developed independently by Ciba-Geigy Corporation and was not formally commented on by EPA. The CFS incorporated the results of the innovative vacuum extraction process for clean-up of the lagoon soils, preliminary results of the Off-Site RI and additional studies for the installation of groundwater recovery wells. Some of the results of the CFS indicated that the contaminants in the bedrock underlying the lagoons would be a source of continuing contamination of the backfilled soil. The study raised the possibility that the remedy selected in the ROD would be of limited effectiveness without the installation of a barrier which would limit upward movement of contamination from the underlying bedrock. On July 29, 1987 Ciba-Geigy Corporation submitted the final draft Operable Units RI report to EPA. This report concluded that much of the site contamination, specifically the dense non-aqueous phase liquids (DNAPLS), were in the underlying bedrock and aquifer. The report also found that a dissolved portion of the DNAPLS was discharging into the Schuylkill River. As a result of the parties proposal based on the CFS, EPA negotiated a Partial Consent Decree with Ciba-Geigy Corporation, SmithKline Beckman, Wyeth Laboratories, and Essex Group to implement an innovative technology, vacuum extraction, which would be more effective than excavation in removing the contamination from the soils and underlying bedrock at the on-site area. The Partial Consent Decree was signed and entered on June 20, 1988. The vacuum extraction process is currently in the construction phase. Several temporary vacuum units have proved to be very successful in reducing the contaminant levels on-site. The complete vacuum extraction process is expected to be on line by the end of October 1988. A ROD addressing Operable Unit 02 at the Tyson's Dump Site was completed in September of 1988. A public meeting on the Proposed Plan was held on February 20, 1996 in Upper Merion Township Pennsylvania. Citizens who attended the meeting did not voice any significant concerns about the preferred alternative. Tyson's Dump site is an abandoned septic and chemical waste disposal site situated within an old sandstone quarry. The site is located in southeastern Pennsylvania, 15 miles northwest of Philadelphia, in upper Merion Township, Montgomery County. Several former unlined lagoons were used to store various industrial, municipal, and chemical wastes. Spills and overflows reportedly occurred during the period of operation, thus allowing for the dispersal of wastes throughout the site. Surface water runoff and seeps also contributed to off-site migration of the wastes northeasterly toward the floodplain of the Schuylkill River. The four acre parcel comprising the former lagoons is bordered both to the east and west by unnamed tributaries to the Schuylkill River, a steep quarry highwall on the south, and a Conrail Railroad switching yard on the north. The Schuylkill River floodplain is on the opposite side of the switching yard. No structures exist within the old lagoon area and heavy vegetation obscures visual observation of contaminated areas. Vehicular access to the site is from Brownlie Road. An access road used during previous dumping operations runs along the northern portion of the site. The major watercourse in the project area is the Schuylkill River. The average discharge at a nearby upstream station is recorded to be 190 cubic feet per second (cfs). Due to frequent floods, over half of the area north of the railroad tracks is within the 10 year floodplain, while most of this area would be inundated by a 50 year flood and all of it would be covered by the 100 year flood. The site itself lies above the 100 year floodplain. Land use in the vicinity of the abandoned disposal site includes residential, commercial and industrial. Immediately adjacent to the site on the western border, is a newly developed residential subdivision. South of the site is zoned residential and agricultural while to the north, the zoning is heavy industrial. The Upper Merion Township as a whole is experiencing rapid growth with several new residential developments being recently completed or proposed. It is expected that land zoned agricultural will be re-zoned for high density residential use.

Norristown is a large residential, commercial and industrial area with a population of 35,000 and is located across the Schuylkill River, approximately 1/2 mile northeast of the site. The smaller residential area of Bridgeport, (population 4,900) is located approximately one mile east and downstream of the site. Belmont Terrace, which contains several hundred single-family dwellings, is located approximately 1/2 mile southeast of the site. A January 1984 draft planning study published by the Delaware Valley Regional Planning Commission recommends that a four-lane arterial be built in Upper Merion Township. This proposed Schuylkill Parkway is proposed to be routed directly over the former lagoon areas. The dump was owned and operated from 1960 to 1968 by companies owned by Franklin P. Tyson and Fast Pollutant Treatment, Inc. Ciba-Geigy Corporation had used the dump to dispose of various wastes during the same time period. General Devices, Inc., the present owner of the site, purchased the property from Tyson in 1968 and claims they did not dump anything since they acquired it. During active operations, several lagoons were constructed within the old quarry pits. Reportedly, liquid septic tank wastes and sludges were hauled to Tyson's Dump in bulk tank trucks and then were disposed in the lagoons. Apparently, lagoons were filled with wastes and covered, and new lagoons were created. These operations were carried out throughout the site thus dispersing contaminants over much of the four acre area. Since lagoons were not lined, wastes were not prevented from migrating off-site via seeps and shallow ground water. Although disposal at this site supposedly was confined to septic tank wastes, the presence of hazardous constituents in soils and ground water indicates that disposal operations included chemical wastes. In 1973, the Pennsylvania Department of Environmental Resources ordered the site owners to close the facility. During closure, the lagoons were to be drained, backfilled and vegetated and the lagoon contents transported off-site. Since closure, the site has been commercially inactive. In January 1983, EPA investigated an anonymous citizen complaint about conditions at Tyson's Dump and subsequently determined that immediate removal measures were required to limit exposure to public health by uncontrolled chemical odors and liquid waste releases from the unsecured site. Nearby residents were traversing the site daily and children were observed by Conrail workers to be frequently riding motorbikes throughout the site. The Schuylkill River received surface runoff from the site and is used as a municipal water supply. Norristown's main drinking water intake (10 MGD) is approximately 2,000 feet downstream in the south channel between Barbados Island and the site. A drinking water intake for the City of Philadelphia is located approximately 13 miles downstream. The river is also used as an industrial water supply for the area, in addition to its recreational use by the general public. A large quarry pit, located approximately 1-1/4 miles south of the site, is used by the Philadelphia Suburban Water Company as a drinking water source. This reservoir provides between 5 to 10 MGD. The floor elevation of the pit is 229 feet below mean sea level (MSL). Several private residences using wells for potable water are located within 1000 feet south and southwest of the site. The initial environmental site survey and sampling results indicated that a variety of hazardous chlorinated and non-chlorinated chemical compounds were present in the soils, air and water within and around the former lagoon areas (on-site) and in the floodplain (off-site). EPA's On Scene Coordinator decided to institute the following immediate removal measures in March 1983: - A security fence was erected to limit unauthorized access to the site. - A leachate collection system was constructed to minimize uncontrolled contaminant discharges to the Schuylkill River and also to reduce volatile organic air emissions. - An air-stripping leachate treatment system was installed to remove volatile organic compounds from collected leachate. - An activated carbon air exhaust system was installed to trap liberated organics from the

air-stripper. - A partial site soil cap was placed over the suspected lagoon areas and hydroseeded. - The area was graded to divert uncontaminated runoff from the old lagoon areas. - An extent-of-contamination survey was conducted to determine the need for additional remedial measures. Data generated from the initial field activities conducted by EPA (January-June 1983) indicated the widespread presence of organic compounds within and surrounding the former lagoon areas. These materials were not removed during closure and still are present in substantial concentrations. The major contaminants found were volatile organic compounds (primarily xylenes, toluenes and 1,2,3-trichloropropane). In addition, chlorinated benzene compounds commonly were detected. The data collected was used in applying the Hazard Ranking System to the Tyson's Dump site which resulted in an overall score of 63.10. Remedial Action Master Plan and Work Plan were prepared and approved in September, 1983. Funding for the Remedial Investigation and Feasibility Study (RI/FS) was also approved in that month. A Record of Decision addressing Operable Unit 01 at Tyson's Dump was completed in December of 1984. A Record of Decision addressing Operable Unit 02 at Tyson's Dump was completed in December of 1988. On August 23, 1988, ERM submitted, on behalf of Ciba-Geigy, the draft Off-site Operable Unit FS to EPA. This report recommended a no-action alternative for the Seep Area, Railroad Area, Hillside Area, and Floodplain/Wetlands areas. The second ROD for the site signed on September 29, 1988 and based upon the Off-Site Operable Unit RI/FS Report, selected the no-action alternative for those areas of this second operable unit. With regard to the deep aquifer, the Off-Site Operable Unit FS primarily focused on the recovery and treatment of contaminated groundwater south of the Schuylkill River. A recovery well network was designed by S. S. Papadopoulos and Associates, Inc. (SSPA) to intercept contaminated groundwater along the south bank of the river. Many treatment alternatives were examined by the Off-Site Operable Unit FS as to their applicability for treatment of the contaminated ground water. Ground water recovery from a line of wells along the south shore of the River with treatment via steam stripping followed by liquid-phase carbon, if required as a polishing step, was selected as the ground water alternative in the second ROD for the Tyson's site. At the conclusion of the Off-Site Operable Unit Feasibility Study (FS), it was determined that additional investigation of the extent of site-related compound migration in the deep aquifer north of the south bank of the Schuylkill River was required before remediation of the ground water affected by the Tyson's site could be fully addressed. Specifically, the objectives of the additional work described in the Third Addendum to the Offsite Operable Unit Remedial Investigation (RI) Work Plan were to: - Complete, to the extent possible, the delineation of the extent of dissolved phase site-related compound migration in ground; - Establish boundaries on the distribution of DNAPLs; and - Obtain sufficient information relative to the mechanisms controlling the movement of ground water south, beneath, and north of the Schuylkill River so that alternatives for remediation of site-related compounds in the deep aquifer could be properly evaluated. The Third Addendum Investigation included the sequential installation of additional monitoring wells on Barbadoes Island and on the north side of the River, along with extensive hydrogeologic testing and ground water sampling. As a result of these activities, sufficient information was obtained on the mechanisms of ground water flow and extent of site-related compounds to permit completion of a focused Feasibility Study for that portion of the deep aquifer that extended to the north bank of the River. The off-site operable unit third addendum RI and FS reports were submitted to EPA in May and June, 1990 respectively. Based on these reports it was determined that additional information on the relationship of the ground water in the deep aquifer north of the river to the river should be obtained. A ROD addressing Operable Unit 3 of the Tysons Dump site was completed in September 1990. The

Site was owned and operated by Franklin P. Tyson and Fast Pollution Treatment Incorporated. The property was used to dispose of septic and chemical waste from 1962 to 1970. The liquid and sludge wastes were hauled to the Site in bulk tank trucks. Waste disposal occurred in a series of unlined lagoons that were created as a result of the sandstone quarry operation. The disposal of wastes into the lagoons resulted in the contamination of the groundwater in bedrock beneath and down gradient of the lagoons. Dissolved waste components and dense non-aqueous phase liquids (DNAPLs) entered the underlying bedrock primarily via direct infiltration from the former lagoons into the highly weathered and fractured bedrock surface. Once in bedrock, flow of the DNAPL and contaminants from waste occurred along bedding planes and fractures within the bedrock. The contaminant 1,2,3-trichloropropane (TCP) was the volatile organic compound (VOC) found most frequently at the Site and at the highest concentrations. Other VOCs commonly detected at elevated concentrations include xylenes, toluene, ethylbenzene and unidentified petroleum distillates. These are also the major compounds that constitute the Site's DNAPL. The Site was placed on the National Priorities List (NPL) on September 21, 1984. A series of Remedial Investigations and Feasibility Studies (RI/FS) were developed for Ciba-Geigy Corporation by ERM, Inc. and S.S. Papadopoulos & Associates, Inc. starting as early as 1983 and ending in 1995. The first RI Report was issued in July 1987 and was followed by a series of RI addendums from 1990 and ending in 1995. Additionally there were a series of Feasibility Studies starting in August 1988 and concluding in 1990. The RI and FS Reports determined that site-related contamination was being released into the Schuylkill River as well as migrating into the bedrock aquifers beneath and beyond the north bank of the Schuylkill River. Historically, DNAPLs have been detected at depths up to 600 feet below ground surface (bgs) and dissolved phase contaminants at various depths greater than 1,000 feet bgs. On June 20, 1988, the potentially responsible parties (PRPs), Franklin P. Tyson, Ciba-Geigy Corporation, General Devices, Inc., Wyeth Laboratories, Inc., Essex Group Inc., and SmithKline Beckman Corp., entered into a judicial consent decree (CD) with the United States on behalf of EPA to remediate the contamination at the Site which included the installation and operation of a soil vacuum extraction (SVE) system, installation and operation of groundwater recovery wells, sediment and soil collection from the tributary that had received effluent from the previous air stripper and operation and maintenance of the new systems to be installed per the CD. On September 28, 1990, EPA issued a Record of Decision (ROD) for the off-site contaminated groundwater that had migrated beneath, and as far as, the north bank of the Schuylkill River (River) (designated as operable unit [OU] 3) that selected a remedy which was designed to capture and treat groundwater effected by site-related compounds emanating from sources on the south side of the River and beneath Barbadoes Island. The remedial goals established in the 1990 ROD were: 1) to contain groundwater, 2) to prevent further migration of the groundwater north towards Norristown, 3) further prevent discharge of contaminated groundwater to the Schuylkill River. The remedy included: - Installation of groundwater recovery wells on Barbadoes Island to capture groundwater impacted by site-related compounds and pipe it to the existing treatment system on the south side of the Schuylkill River; - Expansion of the groundwater recovery system (selected in the 1988 ROD for OU2) on the south side of the River from six (6) to thirteen (13) wells; - Upgrading and expansion of the current groundwater treatment system; - Groundwater and surface water monitoring; and, - Institutional controls (ICs). The 1990 ROD stated that if another location was selected for the Barbadoes Island recovery wells based on additional data to be collected by the PRPs, EPA would issue an ESD documenting this change. The ROD also stated that if implementation of the selected remedy demonstrated, in corroboration with hydrogeological and chemical evidence that it would be technically impracticable to achieve and

maintain the remediation goals throughout the area of attainment, the EPA in consultation with the Commonwealth of Pennsylvania, intended to amend the ROD or issue an Explanation of Significant Differences to inform the public of alternative groundwater goals. On September 28, 1990, the EPA issued a ROD for the off-site contaminated groundwater and DNAPL associated with the Tyson's Dump Site that had migrated beneath, and as far as, the north bank of the Schuylkill River. Installation of the additional six (6) wells to the groundwater recovery system along the south bank of the River was completed in June 1991. The groundwater treatment system upgrade and expansion was completed in 1991. Additional investigations to more fully characterize the bedrock (specifically with respect to Barbadoes Island, at depths of 1,000 feet or more) and to evaluate the capture zone of the thirteen (13) well groundwater extraction system were completed. Results of these investigations were reported in the Fourth Addendum RI, Fifth Addendum Phase I RI (1994), and Fifth Addendum Phase II RI. The major conclusions presented in these reports are summarized below: -DNAPLs were physically observed in wells completed to depths of nearly 600 feet bgs at a distance of nearly 1,500 feet from the former disposal lagoons. In addition, the presence of dissolved phase contamination on the north side of the river indicated that DNAPLs may have migrated to beneath the north bank of the Schuylkill River. -Given the cessation of disposal activities nearly 30 years ago and the propensity for DNAPL to dissolve into the matrix of the bedrock or sorb to bedrock fracture surfaces, the potential for the DNAPL sources to migrate north in the future was considered very low. -The DNAPL sources within the bedrock aquifer could not be removed with current technology and would remain a long-term source of groundwater contamination. Given the above, the most effective approach for Site groundwater remediation was to contain the dissolved phase plume directly impacted by DNAPL to prevent further migration of contaminants and to establish ICs to prevent future use of the affected aquifer. -Groundwater modeling was conducted in two phases. The first was to design a system to cut off groundwater discharge to the River with the extraction wells on the south bank. The second phase was used to confirm that the capture zone of the thirteen (13) well extraction system extended to the north-northeast as much as 2,000 feet and extended to depths as great as 500 feet bgs. The thirteen (13) well extraction system provided containment of most of the dissolved contamination that could potentially be discharging to the River. The lack of site-related compounds in the north and south channels of the Schuylkill River, during the many years of operation of the recovery system, also indicated that the recovery system provides containment for contaminated groundwater that could potentially be discharging to the River. These wells are still in operation. -Groundwater affected by site-related compounds below 500 feet enters into a flow system related to the occurrence of a more permeable zone in the deeper bedrock. This zone is associated with an unconformity which varies from 750 to 1,100 feet below the Site and vicinity. Groundwater flow within this zone at the Site appears to be to the southeast (see the attached conceptual site model for graphical presentation of these findings). Groundwater withdrawal centers south and southeast of the Site provide hydraulic boundaries to this flow system. As a result of these findings two additional wells, DB-13 (on the central portion of Barbadoes Island) and DB-14 (on southern shore of the Schuylkill River, east of the thirteen well extraction system) were installed into the deeper aquifer and hydrogeologically tested. After evaluation of the DB-14 tests, it was determined that the well was suitable for containment and recovery of Site-related contaminants in the deep aquifer system. Pumping of well DB-14 at a rate of 40 gpm commenced on February 9, 1998. Well DB-14 is currently pumped at a rate of 30 gpm. DB-13 is utilized as a monitoring well. Institutional controls were evaluated and the final IC Implementation Plan (ICIP) was submitted in the Interim Remedial

Waste code: D002

Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003

Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

PA-EFACTS (Pennsylvania - Environmental Facility Application Compliance Tracking System) is a Department-wide database that provides a holistic view of clients and sites (including facilities) that DEP regulates.

Hazardous Waste Summary:

Waste code: D001
 Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
 Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

PA-EFACTS (Pennsylvania - Environmental Facility Application Compliance Tracking System) is a Department-wide database that provides a holistic view of clients and sites (including facilities) that DEP regulates.

Hazardous Waste Summary:

Waste code: D001
 Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
 Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: P001
 Waste name: 2H-1-BENZOPYRAN-2-ONE, 4-HYDROXY-3-(3-OXO-1-PHENYLBUTYL)-, & SALTS, WHEN PRESENT AT CONCENTRATIONS GREATER THAN 0.3%

Waste code: D001
 Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
 Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
 Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and

corrective action activities required under RCRA.

PA-EFACTS (Pennsylvania - Environmental Facility Application Compliance Tracking System) is a Department-wide database that provides a holistic view of clients and sites (including facilities) that DEP regulates.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and its Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Hazardous Waste Summary:

Waste code: D001
 Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
 Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
 Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES

Waste code: D002
 Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
 Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

 Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

PA-EFACTS (Pennsylvania - Environmental Facility Application Compliance Tracking System) is a Department-wide database that provides a holistic view of clients and sites (including facilities) that DEP regulates.

Hazardous Waste Summary:

Waste code: D001
 Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D039
 Waste name: TETRACHLOROETHYLENE

Waste code: F001
 Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

PA-EFACTS (Pennsylvania - Environmental Facility Application Compliance Tracking System) is a Department-wide database that provides a holistic view of clients and sites (including facilities) that DEP regulates.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Waste code: D001
 Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. Waste code: D002
 Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Hazardous Waste Summary:

Waste code: D001
 Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Waste code:	D003
Waste name:	A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: D001
 Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Waste code:	D003
Waste name:	A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Hazardous Waste Summary:

Waste code: D002
 Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D008
 Waste name: LEAD

Waste code: D001
 Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

LIENS 2: CERCLA Lien Information

A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

EDR PROPRIETARY RECORDS

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR US Hist Auto Stat: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.
